Subject:

rush seq search req

Hi Christina-

Please approve the following for a due amended:

STIC:

Please do a regular and interferences search of SEQ ID NO: 26 (full length) and an oligo search of 30 contiguous amino acids of SEQ ID NO: 26 for 08/741095

Thanks,

Elizabeth (Betsy) Kemmerer Art Unit 1646 308-2673 CM1-10B17

Baker
Sequence
                    The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                              Disclosure;
                                                                                                                                              WPI; 2001-308046/32
                                                                                                                                                                                                                                                                                                                                                                                                                      02-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-terminus of a mature human TANGO-69-receptor:IgG1 Fc fusion protein. The fusion protein was expressed in HEK 293T cells that had been transfected with a vector carrying a gene fusion composed of the human TANGO-69-receptor (sHVEMI, see AAZ94195) coding sequence and DNA encoding the Fc domain of human IgG1. sHVEMI (see also AAY9204) is a novel soluble form of membrane-bound herpesvirus entry
                                                                                                                                                                                                                                                          19-JUL-2000; 2000WO-US19774

These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CHLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) c.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or

The fusion protein is useful for generating an immune response against HCV in a mammal, particularly a cytotoxic T lymphocyte (CTL) response for either therapeutic or prophylactic treatment against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein will activate CD8+ cells which recognise and lyse target cells displaying an NS5a epitope. The present sequence was useful in the production of the invention which includes fusion proteins comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents cytotoxic T lymphocyte epitopic peptide p214K9 which comes from hepatitis C virus NS5a protein (HCV-NS5a), this sequence was used in an experiment of the invention to show that immunisation with plasmid or naked DNA encoding an NS3NS4NS5a fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus (HCV) polypeptides and fusion proteins, useful for stimulating cell-mediated immune responses, particularly for therapeutic or prophylactic treatment against HCV infection hepatitis C

Sequence
                 The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                             Disclosure;
                                                                                                                                                                                                        19-JUL-2000;

                                                                                                                                                                                                                                           The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HIA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epicope such as those given in \LambdaAJO0010-AAJO4121. These are derived from HCV HILA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                         The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AaJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                02-JUL-2001
                                                                                                                                                                 AAJ03766;
                                                                                                                                                                                  AAJ03766 standard;
                                                                                                                                                                                                                                                                                                                               The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HIA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        A new composition useful as a vaccines

Baker DM,
                    The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ0010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                     Sette
                                                                                                              A new composition useful as a vaccines against hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Q
                                                                                                                                                                           CC A composition (A) comprises at least a first dimerisation peptide (I)

CC comprising the sequence (S1) that is no more than 8 amino acids long,

CC where the composition optionally comprises a second dimerisation peptide

CC (II): NH2-X1-X2-X3-X4-X5-COOH (S1) where X1 to X4 = Ala, Val, Ile, Ieu,

CC TIP, Phe, Met, or Tyr, and X5 = Lys, Arg, Asp or Glu;

CC NH2-X1-X2-X3-X4-X5-COOH (II). The compositions of the invention are

CC displayed intracellularly or extracellularly and are useful to identity

CC binding proteins and molecules, and to modulate intracellular signalling

CC its bloactive potential. The invention can be used to access molecules

CC or targets within living cells, and then provide for the isolation of

CC the constrained protein which has a phenotypic effect on the living

CC cells. The methods are also useful to identify in vitro binding partners

CC of the constrained protein. The compositions of the invention are useful

CC as a scaffold for gene therapy and for potential use as a therapeutic

CC in physiological fluids. The present sequence is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes peptides which have a moderate or high affinity for each other, when added as extensions to both the N-terminus and C-terminus of a protein, can be used to help fold the protein into a compact structure. This compact structure is more stable to proteases.
                                                                                                                                                  Sequence

FEBS Lett. 54:100-102(1975)
-I- FUNCTION: MAIN TOXIN OF BEE VENOM WITH STRONG HEMOLYTIC ACTIVITY.
INTEGRATES INTO CELL MEMBRANES AND HAS MULTIPLE EFFECTS, PROBABLY
AS A RESULT OF ITS INTERACTION WITH NEGATIVELY CHANGED
PHOSPHOLIPIDS. IT INHIBITS WELL KNOWN TRANSPORT PUMPS SUCH AS THE
NA(+)-K(+)-ATPASE AND THE H(+)-K(+)-ATPASES THE
PERMEABILITY OF CELL MEMBRANES TO IONS, PARTICULARLY NA+ AND
INDIRECTLY CA2+, BECAUSE OF THE NA(+)-CA(2+)-EXCHANGE.
-I- SUBUNIT: MOMOMER AND HOMOTETRAMER (BY SIMILARITY).
                                                                                   Hemolysis;
